

The SigLib™ ANSI C source DSP library has been designed to provide the highest level of functionality and portability. SigLib contains over 550 base functions and over 40,000 lines of code, it is fully supported with example programs and documentation. While SigLib has been fully coded in ANSI C for maximum portability, it has been written to make maximum use of optimisation techniques such as look-up-tables etc. SigLib is always ported to the latest generations of DSP and high performance micro-processors, guaranteeing that your application code will never become redundant.

The SigLib library drastically reduces the development time for a DSP product by allowing the engineer to design their application on a desktop workstation or PC and then deploy on their chosen embedded platform. The full source code for the library and examples are supplied, allowing for easy modification.

Applications of SigLib include: Telecommunications (e.g. UMTS 3G mobile radio, wireline telephony and Voice Over IP), Analysis and active control of sound and vibration (for example drill string), Electronic intelligence, Sonar, Radar, System simulation, Medical imaging, Room response analysis and Audio effects.

Registered users of SigLib get one year's free upgrade maintenance, technical support and DSP algorithm implementation advice. SigLib is a complimentary product to Digital Filter Plus, an FIR and IIR digital filter design program for Windows™ or Linux™.

---

### SigLib Functional Overview

**Spectrum Analysis** : FFTs forward and inverse - real, complex, zoom-FFT. Cooley and Tukey (radix 2) and arbitrary length FFTs. Spectrogram, microscan, 2 real with 1 complex FFT, auto and cross power spectrum, power spectral density, chirp z-transform. Welch power spectrum.

**Windowing** : real and complex - Hanning, Hamming, Blackman, Triangle, Rectangle, Kaiser, Blackman-Harris and flat top; with or without inverse coherent gain compensation.

**Filtering** : Fixed coefficient : FIR, comb, IIR (including biquad and Nth order, non-causal, all pole and one pole filters), matched filters, filter design methods, polyphase multi-rate (decimation and interpolation), differentiation and integration (including leaky), Hilbert transformers, Goertzel filtering and detection, Gaussian, raised cosine and root raised cosine filters. Bilinear and matched-z transform IIR

filter design. Filter translations : LPF-LPF, LPF, HPF, LPF-BPF & LPF-BSF. Frequency domain (overlap-add and overlap-save), BPF generate.

Adaptive coefficient : LMS (7 variants).

**Array Processing** : Add, subtract, multiply, divide, square, square root etc. Decimation and interpolation (both with and without filtering). Coherence detection. Overlap and add. Linear to dB and dB to linear. Mean square error. Automatic Gain Control (AGC) , zero crossing detect.

**Control** : Proportional Integral and Differential (PID), Pulse Width Modulation (PWM).

**Signal Generation** : sine, cosine, white and Gaussian noise, chirp (linear and non-linear), square, triangular, sawtooth, impulse, PN sequence, resonators.

**Statistical Analysis** : sum, sum of squares, mean, average, standard deviation and variance, kurtosis, time and frequency domain interpolation. Combinations and permutations.

**Regression Analysis** : linear, logarithmic, exponential, power, trend analysis and de-trending.

**Imaging Coding And Processing** : 3x3 convolution, histogram, 2D FFT, median, Sobel, threshold etc., histogram equalisation, 8x8 DCT forward and inverse, zig zag scan and descan.

**Communications** : Modulation and demodulation of AM, FSK, CP-FSK, BPSK, Differential BPSK, FM, QAM, DQPSK, QPSK and Differential QPSK. Scrambler / de-scrambler, complex shift, spectral inversion, envelope detection, channel multiplex and de-multiplex. DTMF generation and detection. Bit error rate, interleave / de-interleave. Phase locked loop, Costas loop. Timing error detectors – including zero-crossing and early-late-gate. Trellis coded modulation / convolutional encoders, Viterbi decoders, Euclidean distance. Manchester encoding and decoding. 180 degree phase shift detector. Synchronous to asynchronous converters.

**Speech Processing** : Pre- and de-emphasis filtering. ADPCM encoding.

**Digital Audio Effects** : reverb, delay, distortion, echo, pitch shifting (time and frequency domain).

**Vector Math** : Real and complex; Polar and rectangular functions. Scaling (linear and logarithmic), square root, offset, find : minimum / maximum / middle, clip, threshold, offset, rotate, lengthen and shorten, add, subtract, multiply, divide, histogram, quantise, absolute, peak hold, polynomial expansion, sign, modulus, inverse, conjugate, logarithm, exponential, raise to a power, magnitude, phase and group delay, real and complex dot-product, weighted vector sum.

**Utility Functions** : Fixed/floating point conversions. Delays and FIFO arrays.

**Convolution, Correlation and Covariance** : Linear, circular and partial functions. Deconvolution.

**Matrix Algebra** : Add, subtract, multiply, divide, LU decomposition, determinant, linear algebra solving. Column, row and region insert and extract. Column and row swapping.

---

**SigLib** supports : 80x86, Power PCs, SPARC, DEC Alpha; StarCore™ MSC810x, TMS320C3X, TMS320C4X, TMS320C6000, LSI Logic ZSP™, ADSP-2106x, ADSP-2116X SHARC® and TigerSHARC. ARM®, Keil μVision®, IAR Embedded Workbench®. **SigLib** is compatible with Texas Instruments' TMS320 Algorithm Standard. PortAudio and wxWidgets OS independent APIs.

**SigLib** OS support includes : DSP/BIOSII™, Windows™ NT/9x/2000/ME/XP, WindowsCE, Windows Mobile, Solaris and Linux. The **SigLib** DLL supports : C/C++, Excel, Visual Basic, Agilent VEE™, National Instruments' LabVIEW™, Java, Perl, C#, Ch C/C++ interpreter and more.

Run Time Licenses are not required when the **SigLib** object code is embedded in executable module(s) which form part, or all of a product(s).
